1. Summary of test results

The test results apply exclusively to the test samples as presented in this Report. The CETECOM GmbH does not assume responsibility for any conclusions and generalizations taken in conjunction with other specimens or samples of the type of the item presented to tests.

Also we refer on special conditions which the applicant should fulfill according §2.927 to §2.948, special focus regarding modification of the equipment and availability of sample equipment for market surveilance tests.

The \underline{E} quipment \underline{U} nder \underline{T} est (in this report, hereinafter referred as EUT) supports radiofrequency technologies. This test report shows results for W-CDMA technologies only. Other implemented wireless technologies were not considered within this test report.

Remarks:

1.) EUT DC powered only, test to be performed on OEM side if applicable

1.2. Attestation:

I declare that all measurements were performed by me or under my supervision and that all measurements have been performed and are correct to my best knowledge and belief to Industry Canada standards. All requirements as shown in above table are met in accordance with enumerated standards.

The test report version TR-20835060b/15-C1 dated 2015-08-01 substitutes report no. TR-20835060b/15 dated from 2015-06-28. The substituted report gets invalid herewith.

^{*)} EUT operating mode no. is used to simplify the test report.

3.6. RMC99 SETTINGS

Output power considerations for WCDMA mobile equipment

The maximum output power is verified for Low, Middle and High channels according the general descriptions in section 5.2 of 3GPP TS34.121. Following table shows the references to the relative chapter.

| Test | Rel99 | HSDPA | | HSUPA |
|------------|-------|-------|-------|-------|
| Max. Power | 5.2 | 5.2A | 5.2AA | 5.2B |

3.7. 3GPP Release 99

The default test configuration and radio link is 12.2 kbps Reference Measurement Channel configured in test loop mode 1. This RMC defines one code channel in I-branch (DPDCH) and one code channel on the Q-branch. (DPCCH). Compressed mode is switched off.

The uplink contains one DPCCH and up to 6 DPDCH channels. The radio link contain simultaneous data, voice, data, video and packet data and signalling. The nominal maximum output power are defined according to the power class of the EUT. All the parameters are defined using the UL reference measurement channel (12.2kbps), as specified in clause C2.1 of 3GPP TS34.121.

C.2.1 UL reference measurement channel (12,2 kbps)

The parameters for the 12,2 kbps UL reference measurement channel are specified in table C.2.1.1, table C 2.1.2, table C 2.1.3 and table C.2.1.4. The channel coding for information is shown in figure C.2.1

Table C.2.1.1: UL reference measurement channel physical parameters (12,2 kbps)

| Parameter | Level | Unit |
|---|------------|------|
| Information bit rate | 12,2 | kbps |
| DPDCH | 60 | kbps |
| DPCCH | 15 | kbps |
| DPCCH Slot Format #i | 0 | - |
| DPCCH/DPDCH power ratio | -5,46 | dB |
| TFCI | On | - |
| Repetition | 23 | % |
| NOTE: Slot Format #2 is used for closed loop tests in clause 7.6.2. Slot Format #2 and #5 are used for site selections transmission tests in subclause 7.6.3. | on diversi | ty |

| | (TF0, TF0), (TF1, TF0), (TF0, TF1), (TF1, TF1) |

In order to measure the maximum output power the base station set and send continuously power control commands to the EUT. TPC bits were set all up ("1").

Physical channels during connection for non-HSDPA test cases

The following clauses describe the downlink Physical Channels that are transmitted during a connection i.e., when measurements are done. For these measurements the offset between DPCH and SCH shall be zero chips at base station meaning that SCH is overlapping with the first symbols in DPCH in the beginning of DPCH slot structure.

E.3.1 Measurement of Tx Characteristics

Table E.3.1 is applicable for measurements on the Transmitter Characteristics (clause 5) with the exception of clauses 5.3 (frequency error), 5.4.1, 5.4.4 and 5.5.2.

Table E.3.1: Downlink Physical Channels transmitted during a connection

| Physical Channel | Power |
|------------------|----------------------------|
| Îor | -93 dBm / 3,84MHz |
| CPICH | CPICH_Ec / DPCH_Ec= 7 dB |
| P-CCPCH | P-CCPCH_Ec / DPCH_Ec= 5 dB |
| SCH | $SCH_Ec / DPCH_Ec = 5 dB$ |
| PICH | PICH_Ec / DPCH_Ec= 2 dB |
| DPCH | -103,3 dBm / 3,84MHz |

E.3.2 Measurement of Rx Characteristics

Table E.3.2.1 is applicable for measurements on the *Receiver Characteristics* (clause 6) including clauses 5.3 of 3GPP, Frequency Error.

Table E.3.2.2 describes the downlink Physical Channels that are required for the test of Spurious Emissions (clause 6.8). The UE is in the CELL_FACH state during the measurement.

Table E.3.2.2: Downlink Physical Channels transmitted during the RX Spurious Emissions test

| Physical Channel | Power |
|------------------|------------------------------|
| CPICH | -86dBm / 3,84MHz |
| P-CCPCH | P-CCPCH_Ec/ CPICH_Ec= -2 dB |
| SCH | SCH_Ec / CPICH_Ec= -2 dB |
| PICH | PICH_Ec / CPICH_Ec= -5 dB |
| S-CCPCH | S-CCPCH_Ec / CPICH_Ec= -2 dB |

4. Description of test system set-up's

4.1. Test system set-up for conducted measurements at antenna port

Cellular Conducted RF-Setup 1 (Cel-1 Set-up)

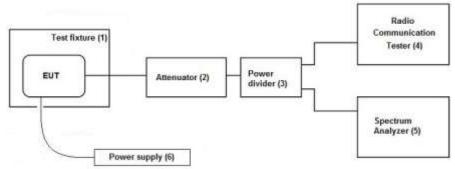

Tests Specification: Conducted spurious emissions, Emission Bandwidth

The EUT's RF-signal is coupled out by a suitable antenna coupling connector (1). The **General Description:**

signal is first attenuated (2) before it is 0° divided by a power divider (3). One of the RF-signal path is connected to the test unit communication tester (4), other RF-path is connected to the spectrum - analyzer (5) for specific RF-measurements. The specific attenuation losses for both signal paths/branches are determined prior to the measurement within a set-up calibration. These are then taken into account by

correcting the measurement readings on the spectrum-analyzer.

4.2. Test system set-up for radiated magnetic field measurements below 30 MHz

Specification: ANSI C63.4-2014 chapter 8.2.1, ANSI C63.10-2013 Chapter 6.4

General Description: Evaluating the radiated field emissions are done first by an exploratory emission measurement and a final measurement for most critical frequencies determined.

The loop antenna was placed at 1 m height above ground plane and 3 m measurement distance from set-up for investigations. Because of reduced measurement distance, correction data were applied, as stated in chapter "General Limit - Radiated field strength emissions below 30 MHz". The tests are performed in the semi anechoic room recognized by the regulatory commission.

Schematic:

Testing method:

Exploratory, preliminary measurement

The EUT and it's associated accessories are placed on a non-conductive position manipulator (tipping device) of 0.8 m height which is placed on the turntable. By rotating the turntable (step 90°, range 0°to 360°) and the EUT itself either on 3-orthogonal axis (portable equipment) or 2orthogonal axis (defined operational position of EUT), the emission spectrum was recorded. The loop antenna was moved at least to 2-perpendicular axes (antenna vector in direction of EUT and parallel to EUT) in order to maximize the emissions. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a data reduction table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case. Also the interconnection cables and equipment position were varied in order to maximize the Final measurement on critical frequencies

Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT's worst-case operation mode, cable position, etc.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined.

Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself either over 3-orthogonal axis (not defined usage position) or 2-orthogonal axis (defined usage position).

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out.

Formula:

$$E_C = E_R + AF + C_L + D_F - G_A$$

 $M = L_T - E_C$

AF = Antenna factor

 $C_L = Cable loss$

D_F= Distance correction factor

 E_C = Electrical field – corrected value

 E_R = Receiver reading

G_A= Gain of pre-amplifier (if used)

 $L_T = Limit$

M = Margin

All units are dB-units, positive margin means value is below limit.

Distance correction:

Reference for applied correction (extrapolating) factors due to reduced

measurement distance:

ANSI C63.10:2013, $\S6.4.4.2$ - Equations (2) + (3) + (4)

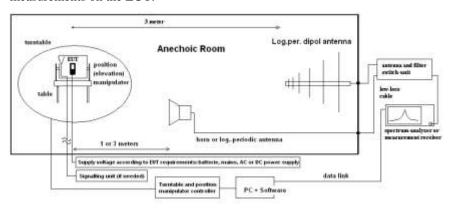

4.3. Test system set-up for radiated spurious emission measurements

Specification: ANSI C63.10-2013 chapter 6.6.3.3 & 6.6.4

General Description:

Evaluating the emissions have to be done first by an exploratory emissions measurement and a final measurement for most critical frequencies. The tests are performed in a CISPR 16-1-4:2010 compliant fully anechoic room (FAR) recognized by the regulatory commission. The measurement distance was set to 3 meter for frequencies up to 18 GHz and 2 meter above 18 GHz. A logarithmic periodic antenna is used for the frequency range 30 MHz to 1 GHz. Horn antennas are used for frequency range 1 GHz to 40 GHz. The EUT is aligned within 3 dB beam width of the measurement antenna with three orthogonal axis measurements on the EUT.

Schematic:

Testing method:

$\label{eq:exploratory} \textbf{Exploratory, preliminary measurements}$

The EUT and its associated accessories are placed on a non-conductive position manipulator (tipping device) of 1.50 m height which is placed on the turntable. By rotating the turntable (range 0° to 360° , step 45°) and the EUT itself on 3-orthogonal axis (the emission spectrum and it's characteristics was recorded with an EMI-receiver, broadband antenna and software.

The measurements are performed in horizontal and vertical polarization of the measurement antennas. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case of them. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

Formula:

$$E_C = E_R + AF + C_L + D_F - G_A$$
 (1)

 $Ec_{E(I)RP} = Ec - 95.2 dB$

 $M = L_T - Ec_{E(I)RP}$

Final measurement on critical frequencies

Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT's worst-case operation mode, cable position, etc.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined. Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself over 3-orthogonal axis and the height for EUT with large dimensions.

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out. The readings on the spectrum analyzer are corrected with conversion value between field strength and E(I)RP, so the readings shown are equivalent to ERP/EIRP values. Critical measurements near the limit are re-measured with a substitution method accord. ANSI/TIA/EIA 603 C/D

 E_C = Electrical field – corrected value

 E_R = Receiver reading

M=Margin

 $L_{\text{T}} = Limit$

AF = Antenna factor

 $C_L = Cable loss$

 D_F = Distance correction factor (if used)

 G_A = Gain of pre-amplifier (if used)

 $Ec_{E(I)RP}$ = Electrical field corrected for E(I)RP

All units are dB-units, positive margin means value is below limit.

| | The measurements were performed with the integrated power measurement function of the "radio communication tester CMU200 from Rohde&Schwarz company. In this way spectrum-analyzers instrument limitations can be avoided or minimized. Instead, CMU manufacturers declared measurement error can be considered for this measurement. |
| Measurement method | The attenuation (insertion loss) at the RF Inputs/Outputs of CMU were set according the path loss of the test set-up, determined in a step before starting the measurements. A suitable artificial antenna or RF-connector is provided by the applicant in order to perform the conducted measurements. Any data provided with the artificial antenna or connector, have been taken in account in order to correct the measurement data. (typical 0.3dB for attenuation of antenna connector) |
| | Peak and Average Values have been recorded for each channel and band. The Peak-to -Average-Ratio is determined by integrated CCDF function of the ESU spectrum-analyzer. Details to the settings used can be taken from the diagrams enclosed in annex 1. |
| EUT settings | A call was established on highest power transmit conditions in RMC99 mode. UE is set TX mode, highest transmit power conditions, DTX, MPR or other power saving techniques have been disabled |
| | The measurements were made at the low, middle and high carrier frequencies of each of the supported operating band. Choosing three TX-carrier frequencies of the wireless device, should be sufficient to demonstrate compliance. |

| Measurer | * | | The measurements were performed by using the substitution method (ANSI/TIA/EIA 6030 with a spectrum-analyzer. This method can be described like follows: 1. choosing of suitable spectrum-analyzer settings for performing the measurements. Settings of the spectrum analyzer must be maintained for both stages of measurements: EUT emission measurements and also for measurements of substituted level. 2. The maximum level of the peak power was recorded, while the emissions we maximized by rotating the EUT in three orthogonal axes, which was situated on a reconductive turntable of 1.55 m height (P _{MEAS,1}). This was performed for both measurement and polarisations (vertical/horizontal), the maximum of both values is used further measurements and final substitution (P _{MEAS,1,MAX}). 3. As the maximum emission is recorded, the EUT is replaced by a frequency depends suitable antenna, which is connected to a RF-signal generator, which is transmitting the determined worst-case frequency as determined in step 2. 4. The RF-signal level of the signal generator is adjusted as long the same worst-level determined first step is measured at the spectrum analy (P _{SMHU} =P _{MEAS,1,MAX}) 5. Than the RF-signal cable is disconnected from the antenna and connected to a power level meter. The level is determined (P _{MEAS,2}). 6. The final result is calculated by adding the ERP/EIRP gain of the antenna which substitutes the EUT. P _{EUT,SUBST} = P _{MEAS,2} + G _{ANTENNA} | | | |

|-------|--|
| IC | RSS-132, Issue 3: 5.5(i)(ii) RSS-133, Issue 6: 6.5.1(i)(ii) RSS-139, Issue 3: 6.6(i)(ii) |
| Limit | "the power of emissions shall be attenuated below the transmitter output power (p) by at least 43+10Log(P) dB" |

5.4.3. Test condition and test set-up

| 5.4.5. Test condition and test set | | |
|------------------------------------|---|-------------------------|
| Climatic conditions | Temperature: (22±3°C) Rel. humidity: (40±20)% | |
| Test system set-up | Please see chapter "Test system set-up for conducted measurements on antenna port" | |
| Measurement method | The spectrum was scanned from 9 kHz to the 10th harmonic of the highest frequency ger within the equipment. A PEAK detector was used except measurements near the Bandwhere a AVERAGE detector applied. A suitable artificial antenna or RF-connector is provided by the applicant in order to perform conducted measurements. Any data provided with the artificial antenna or connector, have taken in account in order to correct the measurement data. (typical 0.3dB for attenuation antenna connector) | d-Edge n the been |
| Spectrum-Analyzer settings | See below tables | |
| Mobile phone settings | A call was established on highest power transmit conditions in RMC99 mode. The measurements were made at the low, middle and high carrier frequencies of each supported operating band. Choosing three TX-carrier frequencies of the mobile phone, sho sufficient to demonstrate compliance. | |

5.5.5. Correction factors due to reduced meas. distance (f< $30\ MHz$)

The used correction factors when the measurement distance is reduced compared to regulatory measurement distance, are calculated according Extrapolation formulas valid for EUT's with maximum dimension of 0.625xLambda. Formula 2+3+4 as presented in ANSI C63.10, Chapter 6.4.4 are used for the calculations of proper extrapolation factors.

| Frequency -Range | f [ld-tz/MHz] | Lambda [m] | Far-Field Point [m] | Distance Limit accord. 15 209 [m] | 1st Condition (dmeas< Dtats) | 2'te Condition (Limit distance bigger described | Distance Correction accord. Formula |

5.7.2. Requirements and limits

| FCC | §2.1055(a)(1) ■ FDD Band 5: §22.355, Table C-1 ■ FDD Band 2: §24.235 ■ FDD Band 4: §27.54 |
|-------|---|
| IC | ☑ FDD Band 5: RSS-132, Issue 3: 5.3 ☑ FDD Band 2: RSS-133, Issue 6: 6.3 ☑ FDD Band 4: RSS-139, Issue 3: 6.4 |
| Limit | "The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block" |

5.7.3. Test condition and test set-up

| 5.7.5. Test condition and test so | or up |
|-----------------------------------|---|
| Test system set-up | Please see chapter "Test system set-up for conducted measurements on antenna port" In order to maintain the voltage constant over the time period of the tests, a dummy battery was connected to a laboratory power supply. The power supply voltage was controlled on the input of the power supply terminals of the EUT. |
| Measurement method | the power supply terminals of the EUT. The RF Channel spacing is 200 kHz according W-CDMA-Spec, with a guard band. The aim of the EUT is to function under all extreme conditions within authorized sub-bands in regard to temperature and voltage variations. The frequency deviation was recorded with base station's build in capability. (CMU) As the standard requires that the fundamental emissions stays within the authorized band, a limit of |
| Mobile phone settings | O.1ppm is considered low enough to ensure this. A call was established on highest power transmit conditions in RMC99 mode. The measurements were made at the low, middle and high carrier frequencies of each of the supported operating band. Choosing three TX-carrier frequencies of the mobile phone, should be sufficient to demonstrate compliance. Tests have been done in Rel99, 12.2 kbps RMC operating mode. |

5.7.3.1. Frequency shift of carrier against a voltage range at constant nominal temperature of 20° Celsius

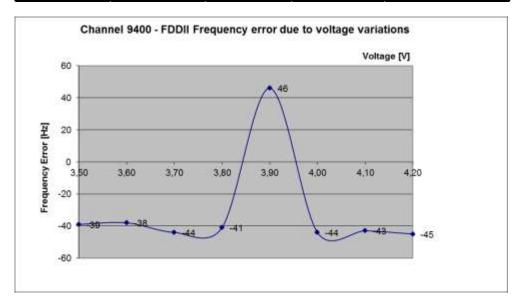

- 1.) determine the carrier frequency for the lowest and highest channel at room temperature and nominal voltage $[20^{\circ}C]$
- 2.) The voltage was reduced in 0.1 Volt steps to the lower end point, where the mobile phone stops working. (this shall be specified by the manufacturer) Record the carrier frequency shift within 2 minutes after powering on the mobile phone, to prevent for self heating effects.
- 3.) The voltage was increased in 0.1 Volt steps to the upper declared voltage of the battery. Record the carrier frequency shift within 2 minutes after powering on the mobile phone, to prevent for self heating effects.

5.7.4.4. Frequency shift of carrier against temperature at constant power supply voltage

- 1.) determine the carrier frequency for the lowest, middle and highest channel at room temperature and nominal voltage $[20^{\circ}C]$
- 2.) expose the mobile station to -30° C, wait sufficient time to have constant temperature.
- 3.) Perform the carrier frequencies measurements in 10°C increments from -30°C to +50°C. For about one hour at the specified temperature the mobile was powered-off. After powering-on, the measurements were made within 2 minutes to prevent self-warming of the mobile.

5.8. Measurement uncertainties

The reported uncertainties are calculated based on the standard uncertainty multiplied with the appropriate coverage factor \mathbf{k} , such that a confidence level of approximately 95% is achieved.

For uncertainty determination, each component used in the concrete measurement set-up was taken in account and it's contribution to the overall uncertainty according it's statistical distribution calculated.

Following table shows expectable uncertainties for each measurement type performed.

| RF-Measurement | Reference | Frequency range | Calculated uncertainty based on a confidence level of 95% | | | | | ì | Remarks |

8.0.3. Legend

| Note / remarks | | Calibrated during system calibration: |
|----------------|-----|---|
| | 1a | System CTC-SAR-EMS (RefNo. 442) |
| | 1b | System-CTC-EMS-Conducted (RefNo. 335) |
| | 1c | System CTC-FAR-EMI-RSE (RefNo . 443) |
| | 1d | System CTC-SAR-EMI (RefNo . 441) |
| | 1e | System CTC-OATS (EMI radiated) (RefNo. 337) |
| | 1 f | System CTC-CTIA-OTA (RefNo . 420) |
| | 1 g | System CTC-FAR-EMS (RefNo . 444) |
| | 2 | Calibration or equipment check immediately before measurement |
| | 3 | Regulatory maintained equipment for functional check or support purpose |
| | 4 | Ancillary equipment without calibration e.g. mechanical equipment or monitoring equipment |
| | 5 | Test System |

| Interval of calibration | 12 M | 12 month |
|-------------------------|---------|---|
| | 24 M | 24 month |
| | 36 M | 36 month |
| | 24/12 M | Calibration every 24 months, between this every 12 months internal validation |
| | 36/12 M | Calibration every 36 months, between this every 12 months internal validation |
| | Pre-m | Check before starting the measurement |
| | - | Without calibration |

9. Versions of test reports (change history)

| Version | Applied changes | Date of release |
|---------|---------------------------|-----------------|
| | Initial release | 2015-06-28 |
| C1 | Inclusion of CCDF results | 2015-08-01 |
